

AMENDMENTS TO THE CLAIMS:

Please cancel claims 18-21 without prejudice or disclaimer.

1. (Currently amended) A method for detecting whether an image of a characteristic portion exists in an image to be processed, comprising:

sequentially cutting images of a required size from the image to be processed; ~~and~~
comparing the cut images with verification data corresponding to the image of the characteristic portion; ~~and~~ [[,]]

~~limiting wherein a limitation is imposed on a size range of the image of the~~
characteristic portion with reference to the size of the image to be processed, based on information about a distance between a subject and a location of imaging the subject, obtained when the image to be processed has been photographed, thereby limiting the size of the cut images to be compared with the verification data.

2. (Currently amended) The method according to claim 1, wherein ~~said limiting said size range comprises using the limitation is effected through use of~~ information about a focal length of a photographing lens in addition to the information about a distance to the subject.

3. (Currently amended) The method according to claim 1, wherein ~~the comparison is performed through use of a resized image into which the image to be processed~~ comprises an image obtained by resizing an input image has been resized.

4. (Withdrawn) The method according to claim 3, wherein the comparison is effected through use of the verification data corresponding to the image of a characteristic portion of determined size by changing a size of the resized image.

5. (Withdrawn) The method according to claim 3, wherein the comparison is effected through use of the verification data, the data being obtained by changing the size of the image of the characteristic portion while the size of the resized image is fixed.

6. (Original) The method according to claim 1, wherein the verification data comprises template image data pertaining to the image of the characteristic portion.
7. (Withdrawn) The method according to claim 1, wherein the verification data comprises data prepared by converting an amount of characteristic of the image of the characteristic portion into digital data.
8. (Withdrawn) The method according to claim 1, wherein the verification data is formed from data upon which at least one rule for extracting the amount of the image of the characteristic portion has been applied.
9. (Currently amended) A The method of limiting a range in which an image is processed, comprising
providing information about a position of a characteristic portion extracted from a first image, the information being obtained by the method according to claim 1;
limiting a range in which an image of a characteristic portion of a second image to be processed followed by said a first image to be processed, is retrieved through use of said information about a position of a characteristic portion extracted from the first image, the information being obtained by the method according to claim 1.
10. (Currently amended) A computer-readable medium tangibly embodying a program of machine-readable instructions executable by a digital processing apparatus to perform a method of including set of instructions for detecting whether an image of a characteristic portion exists in an image to be processed, the method set of instructions comprising:
sequentially cutting images of a required size from the image to be processed; and
comparing the cut images with verification data pertaining to the image of the characteristic portion; and [,]
~~wherein the program includes~~ limiting a size range of the image of the characteristic portion with reference to the size of the image to be processed based on information about a distance between a subject and a location of imaging of the subject that is obtained when the

image to be processed has been photographed, to limit the size of the cut images.

11. (Original) The computer readable medium including the set of instructions of claim 10, the instructions further comprising limiting a range in which an image of a characteristic portion of a second image to be processed followed by a first image to be processed is retrieved, through use of information about a position of a characteristic portion extracted from the first image.

12. (Withdrawn) The computer readable medium including the set of instructions of claim 10, wherein the computer readable medium having the instructions is positioned in at least one of an imaging device and an image processing device.

13. (Withdrawn-currently amended) The computer readable medium including the set of instructions of claim 10, wherein the distance information used in said ~~when the instructions execute the~~ limiting said size range corresponds to distance information added to the image to be processed as tag information.

14. (Currently amended) The computer readable medium including the set of instructions of claim 10, further comprising ~~the following instruction:~~ determining the distance information used in said limiting said size range required at the time of execution of the limiting by the instructions.

15. (Withdrawn-Currently amended) The computer readable medium including the set of instructions of claim 14, wherein the determining ~~instruction~~ is performed by at least one of a range sensor, a unit for counting a number of motor drive pulses arising when the focus of a photographing lens is set on a subject, a unit for determining information about a focal length of a photographing lens, a unit for estimating a distance to the subject based on a photographing mode and a unit for estimating a distance to the subject based on a focal length of a photographing lens.

16. (Withdrawn-Currently amended) The computer readable medium including the set of

instructions of claim 10, further comprising ~~wherein the set of instructions further comprises~~ subjecting the verification data to an artificial intelligence system.

17. (Withdrawn) The computer readable medium of claim 16, wherein the artificial intelligence system comprises at least one of a neural network and a genetic algorithm applied to the verification data to provide learned recognition for the image of the subject.

18-21. (Canceled)

22. (New) A method of detecting whether an image to be processed includes an image of a characteristic portion, comprising:

imaging a subject at a location to form an image to be processed;

cutting images from said image to be processed;

comparing the cut images with verification data corresponding to the image of the characteristic portion; and

limiting a size range of the image of the characteristic portion based on information about a distance between said subject and said location of said imaging said subject.

23. (New) The method of claim 22, wherein said distance between said subject and said location of said imaging said subject is determined during said imaging said subject.

24. (New) The method of claim 23, wherein said imaging said subject is performed by using an imaging device comprising a range sensor, said distance being determined based on a signal from said range sensor.
